

You are working on the production Next.js App Router website:

- Brand: BimaHeadquarter
- Domain: <https://bimaheadquarter.com>
- Legal operating company: InsureDesk IMF Pvt. Ltd.
- Business category: Insurance consultancy, insurance advisory, policy assistance, renewals and claims assistance
- Service area: India
- Current issue: When users search Google for “bimaheadquarter”, Google sometimes interprets or autocorrects the query as “RBI headquarters”.
- Objective: Strengthen BimaHeadquarter as a unique business and website entity so search engines and AI systems clearly understand that “BimaHeadquarter” is an insurance consultancy brand and website.

Critical Working Rules

1. First inspect the existing SEO, metadata, schema, sitemap, robots, layout and marketing-page implementation.
2. Do not create unnecessary files.
3. Reuse the existing SEO architecture wherever possible.
4. Do not modify the visible design, spacing, colours, layout, responsiveness or components unless necessary for adding semantic text.
5. Do not remove working functionality.
6. Do not add fake business information, fake reviews, fake awards, fake ratings, fake founding dates or unsupported claims.
7. Do not describe BimaHeadquarter as an insurance company or insurer.
8. Clearly describe it as an insurance consultancy and insurance assistance platform.
9. Do not mention RBI, Reserve Bank of India, “RBI headquarters” or the Google spelling problem anywhere in public website content, metadata or structured data.
10. Do not use keyword stuffing.
11. Do not generate thin doorway pages for every city, insurer or keyword.
12. Use absolute production URLs in all structured data.
13. Keep TypeScript properly typed and ensure the application continues to compile.

1. Correct the Primary Brand Identity

The exact primary brand name must be:

BimaHeadquarter

Use the no-space version as the primary entity because it matches the domain and distinguishes the brand from the generic phrase “Bima Headquarter”.

Update the SEO constants to follow this structure:

```
export const SITE_URL = "https://bimaheadquarter.com";
export const SITE_NAME = "BimaHeadquarter";
export const SITE_ALTERNATE_NAME = "Bima Headquarter";

export const SITE_TITLE =
  "BimaHeadquarter | Insurance Consultancy in India";

export const SITE_DESCRIPTION =
  "BimaHeadquarter is an insurance consultancy operated by InsureDesk IMF Pvt. Ltd., helping individuals and businesses across India with insurance advisory, policy renewals, claims assistance and risk protection solutions.";
```

Use `BimaHeadquarter` consistently as the primary name in:

- Metadata
- Homepage title
- Homepage H1
- Header logo alt text
- Footer
- Open Graph metadata
- Twitter metadata
- JSON-LD structured data
- About page
- Contact page
- Sitemap-related metadata
- Image alt text where the image is specifically the brand logo
- Manifest
- Social profile references

Use `Bima Headquarter` only as an alternate name or where natural sentence readability requires it.

Do not use multiple competing primary names such as:

- Bima Headquarter
- BimaHead Quarter
- Bima Headquarters
- Bima HQ
- Bimaheadquarter

Capitalisation must remain consistent:

`BimaHeadquarter`

2. Do Not Depend on Meta Keywords

The existing keyword arrays may be retained for:

- Content planning
- Internal topic mapping
- Blog planning
- Page-level content generation
- Search intent categorisation

However, do not depend on them to establish search-engine identity.

Check whether the complete `SITE_KEYWORDS` array is being passed into Next.js `metadata.keywords`.

If hundreds of keywords are being rendered into one metadata tag:

- Stop passing the entire global keyword list into every page.
- Do not delete the keyword research arrays if they are used elsewhere.
- Use only a small, relevant, page-specific keyword group where the existing metadata architecture requires it.
- Prioritise page titles, descriptions, headings, visible content, internal links and structured data.

Do not repeat the same large keyword list across every route.

3. Implement WebSite Structured Data

Add valid JSON-LD on the homepage for the website entity.

Use stable `@id` values:

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "@id": "https://bimaheadquarter.com/#website",
  "url": "https://bimaheadquarter.com/",
  "name": "BimaHeadquarter",
  "alternateName": [
    "Bima Headquarter",
    "BimaHeadquarter.com"
  ],
  "description": "BimaHeadquarter is an insurance consultancy helping individuals and businesses across India with insurance advisory, policy renewals and claims assistance.",
  "publisher": {
    "@id": "https://bimaheadquarter.com/#organization"
  },
}
```

```
    "inLanguage": "en-IN"
  }
```

Requirements:

- Render the JSON-LD server-side in the homepage HTML.
- Do not inject it only after client-side hydration.
- Safely serialize JSON-LD.
- Do not create duplicate `WebSite` schemas.
- Ensure only the canonical homepage represents the primary website entity.
- Use the production domain consistently, including the preferred trailing-slash policy already followed by the project.

4. Implement Organization Structured Data

Add an `Organization` entity connected to the website entity.

Use this base structure and populate only information verified in the existing codebase:

```
{
  "@context": "https://schema.org",
  "@type": "Organization",
  "@id": "https://bimaheadquarter.com/#organization",
  "name": "BimaHeadquarter",
  "alternateName": [
    "Bima Headquarter",
    "BimaHeadquarter.com"
  ],
  "legalName": "InsureDesk IMF Pvt. Ltd.",
  "url": "https://bimaheadquarter.com/",
  "description": "BimaHeadquarter is an insurance consultancy operated by InsureDesk IMF Pvt. Ltd., providing insurance advisory, policy renewal assistance and claims assistance across India.",
  "logo": {
    "@type": "ImageObject",
    "@id": "https://bimaheadquarter.com/#logo",
    "url": "USE_THE_EXISTING_ABSOLUTE_LOGO_URL",
    "contentUrl": "USE_THE_EXISTING_ABSOLUTE_LOGO_URL",
    "caption": "BimaHeadquarter"
  },
  "image": {
    "@id": "https://bimaheadquarter.com/#logo"
  },
  "sameAs": [
    "ADD_ONLY_VERIFIED_OFFICIAL_SOCIAL_PROFILE_URLS"
  ]
}
```

```
]
}
```

Add verified properties only when the data already exists publicly on the website:

- Telephone
- Email
- Postal address
- Contact point
- Area served
- Official LinkedIn company page
- Official Instagram page
- Official Facebook page
- Other genuine social profiles

Do not add insurer websites or insurance company profiles to `sameAs`.

They are business partners or service providers, not alternate identities of BimaHeadquarter.

Use:

```
"areaServed": {
  "@type": "Country",
  "name": "India"
}
```

A contact point may be used only with the verified public contact details:

```
"contactPoint": {
  "@type": "ContactPoint",
  "telephone": "VERIFIED_PUBLIC_PHONE_NUMBER",
  "contactType": "customer support",
  "areaServed": "IN",
  "availableLanguage": ["English", "Hindi"]
}
```

Do not add a `LocalBusiness`, `InsuranceAgency` or physical-office schema unless the website displays a real, verified business address and the implementation accurately represents the business.

5. Connect the Structured Data as One Entity Graph

Prefer one connected `@graph` rather than several unrelated JSON-LD objects.

The homepage graph should contain:

- `WebSite`
- `Organization`
- `WebPage`
- `BreadcrumbList` only where appropriate

Connect the entities using stable identifiers:

- `https://bimaheadquarter.com/#website`
- `https://bimaheadquarter.com/#organization`
- `https://bimaheadquarter.com/#webpage`
- `https://bimaheadquarter.com/#logo`

Example relationships:

- `WebSite.publisher` → `Organization`
- `WebPage.isPartOf` → `WebSite`
- `WebPage.about` → `Organization`
- `WebPage.primaryImageOfPage` → verified website image, when available
- `Organization logo` → `ImageObject`

Do not generate a different organization identity on each page.

6. Improve Root Metadata

Inspect the current root `layout.tsx` metadata and implement complete Next.js metadata.

The root metadata should include:

```
export const metadata: Metadata = {
  metadataBase: new URL(SITE_URL),

  title: {
    default: "BimaHeadquarter | Insurance Consultancy in India",
    template: "%s | BimaHeadquarter",
  },

  description: SITE_DESCRIPTION,

  applicationName: "BimaHeadquarter",

  alternates: {
    canonical: "/",
  },
}
```

```

openGraph: {
  type: "website",
  locale: "en_IN",
  url: SITE_URL,
  siteName: "BimaHeadquarter",
  title: SITE_TITLE,
  description: SITE_DESCRIPTION,
  images: [
    {
      url: "USE_EXISTING_VERIFIED_OG_IMAGE",
      width: 1200,
      height: 630,
      alt: "BimaHeadquarter insurance consultancy",
    },
  ],
},

twitter: {
  card: "summary_large_image",
  title: SITE_TITLE,
  description: SITE_DESCRIPTION,
  images: ["USE_EXISTING_VERIFIED_OG_IMAGE"],
},

robots: {
  index: true,
  follow: true,
  googleBot: {
    index: true,
    follow: true,
    "max-image-preview": "large",
    "max-snippet": -1,
    "max-video-preview": -1,
  },
},
};

```

Adapt this to the existing project structure instead of blindly duplicating metadata.

Ensure:

- One canonical URL per public page.
- No public page unintentionally inherits `/` as its canonical.
- Page-level metadata overrides the root canonical correctly.
- Titles are unique and descriptive.
- The brand appears once in page titles, not repeatedly.
- No duplicated title such as `Page | BimaHeadquarter | BimaHeadquarter`.

- Open Graph URLs are absolute after metadata resolution.
- No public page is marked `noindex`.
- CRM and authenticated routes remain excluded from indexing.

7. Strengthen the Homepage Entity Signals

The homepage must visibly and naturally answer:

What is BimaHeadquarter?

Add a concise statement near the hero or introductory content:

BimaHeadquarter is an insurance consultancy operated by InsureDesk IMF Pvt. Ltd., helping individuals, families and businesses across India with insurance advisory, policy renewals and claims assistance.

Use the exact brand in the primary H1.

Recommended H1 direction:

Insurance Guidance and Claims Assistance with BimaHeadquarter

or:

BimaHeadquarter – Insurance Consultancy for Individuals and Businesses

Choose whichever fits the existing design and tone best.

Do not use a generic H1 containing only:

- Insurance Consultancy
- Protect What Matters
- Trusted Insurance Partner
- Best Insurance Services

There must be exactly one clear primary H1 on the homepage.

8. Add a Clear Brand Explanation Section

Without changing the visual design significantly, ensure the homepage or About page answers these questions in visible HTML:

What is BimaHeadquarter?

BimaHeadquarter is an insurance consultancy that helps customers understand insurance options, manage policy renewals and receive assistance during the claims process.

Who operates BimaHeadquarter?

BimaHeadquarter is operated by InsureDesk IMF Pvt. Ltd.

Is BimaHeadquarter an insurance company?

No. BimaHeadquarter is an insurance consultancy and assistance platform. Insurance policies are issued and underwritten by the respective licensed insurance companies.

Where are its services available?

BimaHeadquarter assists individuals and businesses across India, subject to insurer availability, policy conditions and service feasibility.

Use natural website copy. Do not make this section look like content added only for search engines.

FAQ structured data may only be added when:

- The exact questions and answers are visibly present on the page.
- Users can read the complete answers.
- There is no duplicate or hidden FAQ content.
- The answers are factual and legally accurate.

Do not expect FAQ structured data alone to generate a special Google result.

9. Improve the About Page

The About page should clearly establish:

- BimaHeadquarter as the brand name
- InsureDesk IMF Pvt. Ltd. as the operating legal entity
- Insurance consultancy as the business activity
- India as the service area
- The available services
- The company's actual leadership details already present on the website
- Real contact and social-profile links

Recommended opening:

BimaHeadquarter is an insurance consultancy operated by InsureDesk IMF Pvt. Ltd. We help individuals, families and businesses across India understand insurance options, manage policy renewals and receive structured assistance during insurance claims.

Do not overuse words such as:

- Best
- Number one

- Guaranteed
- Lowest premium
- Guaranteed claim settlement
- Trusted by thousands

Only retain such claims when they are supported by clear evidence.

10. Make Branding Consistent Across the Website

Search the public website codebase for all variations of the brand.

Standardise public-facing references so that:

- Primary: `BimaHeadquarter`
- Alternate: `Bima Headquarter`
- Legal entity: `InsureDesk IMF Pvt. Ltd.`

Update inconsistent strings in:

- Navbar
- Footer
- Homepage
- About page
- Contact page
- Blog pages
- Marketing pages
- Image alt attributes
- Metadata
- Manifest
- Open Graph data
- Structured data
- Breadcrumbs
- Copyright text

Do not modify historical content where changing a quoted name would be inaccurate.

11. Add Entity-Relevant Internal Linking

Use descriptive internal anchor text naturally.

Examples:

- About BimaHeadquarter
- BimaHeadquarter insurance services
- Claims assistance
- Commercial insurance consultancy
- Policy renewal assistance

- Contact BimaHeadquarter

Avoid using “click here” for important navigation links.

Ensure the homepage links to:

- About
- Services
- Claims assistance
- Contact
- Relevant commercial insurance pages
- Important blog or guidance resources

Do not create excessive sitewide keyword links.

12. Review Marketing Page Metadata

Each marketing page must have:

- A unique title
- A unique description
- Its own canonical URL
- A clear H1
- Relevant visible content
- A breadcrumb where appropriate
- No global keyword stuffing
- Correct Open Graph values
- Connection to the main Organization entity

Example title patterns:

- Motor Insurance Assistance | BimaHeadquarter
- Health Insurance Guidance | BimaHeadquarter
- Commercial Insurance Consultancy | BimaHeadquarter
- Insurance Claims Assistance | BimaHeadquarter
- Warehouse Insurance Guidance | BimaHeadquarter

Do not create metadata using unnatural combinations such as:

Best Cheap Lowest Premium Motor Insurance Consultant Bhopal India

13. Review Insurer-Related Keywords Carefully

Do not imply that BimaHeadquarter is officially owned, operated or endorsed by any insurer.

Insurer names may appear only when:

- The page genuinely discusses assistance involving that insurer.
- The visible content supports the metadata.
- Trademark ownership is not misrepresented.
- The page does not claim official insurer status without evidence.

Do not create one thin landing page per insurer solely for ranking.

14. Sitemap and Robots Validation

Inspect the current sitemap generation.

Ensure:

- Every genuine public marketing page is included.
- CRM routes are excluded.
- Login routes are excluded.
- API routes are excluded.
- Query-string duplicates are not included.
- Canonical URLs match sitemap URLs.
- Sitemap uses the production domain.
- Change frequency and priority values are reasonable.
- No duplicate routes exist.
- Removed pages are not included.

Inspect `robots.txt` and ensure it references:

```
https://bimaheadquarter.com/sitemap.xml
```

Do not block required CSS, JavaScript, images or JSON-LD.

15. Brand Assets

Verify that the website has:

- A crawlable favicon
- A square brand icon
- A clear logo
- A 1200×630 Open Graph image
- Descriptive logo alt text
- Stable image URLs

The primary logo alt text should be:

```
BimaHeadquarter
```

Do not use keyword-heavy logo alt text.

16. AEO and AI Search Improvements

Improve answer-engine readability through useful visible content, not hacks.

For important service pages:

- Start with a clear definition.
- Answer the main question in the first paragraph.
- Use meaningful H2 headings.
- Add clear eligibility, process, document and limitation sections.
- Use ordered steps for claim and renewal processes.
- Clearly distinguish consultancy assistance from insurer decisions.
- Include factual FAQs where useful.
- Add updated or reviewed dates only when the website genuinely maintains them.
- Link related services contextually.
- Avoid generic AI-generated filler.

Do not create unnecessary files such as:

- `llms.txt`
- Duplicate AI sitemaps
- Hidden AEO text
- Search-engine-only pages
- Keyword blocks in the footer
- Invisible FAQ content

17. Technical Validation

After implementation, verify the server-rendered HTML for the homepage and key marketing pages.

Confirm that the HTML contains:

- Correct `<title>`
- Correct meta description
- Correct canonical
- `og:site_name` set to `BimaHeadquarter`
- Correct Open Graph image
- One H1
- WebSite structured data
- Organization structured data
- Stable matching `@id` references
- No duplicate schemas
- No undefined values
- No malformed JSON
- No placeholder URLs

- No development-domain URLs
- No localhost URLs
- No duplicated metadata
- No accidental `noindex`

Validate structured data syntax and ensure JSON-LD values match visible page information.

18. Testing Requirements

Add or update focused tests only where the project already has an appropriate testing system.

Test at minimum:

1. `SITE_NAME` is exactly `BimaHeadquarter`.
2. Homepage metadata uses the exact brand.
3. Homepage canonical is correct.
4. `WebSite` schema has the correct name and URL.
5. Organization schema references the legal operating company.
6. Organization and `WebSite` entities use stable IDs.
7. Public pages have unique canonical URLs.
8. CRM and login pages remain excluded from the sitemap.
9. JSON-LD serialization does not produce invalid script content.
10. No placeholder schema values remain.

Do not introduce a new testing framework just for these checks.

19. Final Output Required

After completing the work, provide:

1. A concise list of files inspected.
2. A list of files modified.
3. The exact brand-identity changes made.
4. The schemas implemented.
5. Metadata and canonical improvements.
6. Homepage visible-content improvements.
7. Sitemap and robots findings.
8. Any missing verified details that were intentionally not added.
9. Validation results.
10. Any remaining manual actions required in Google Search Console.

Do not claim that Google will immediately stop showing a spelling correction.

The goal is to provide stronger, consistent entity signals. Search-engine interpretation may change only after Google recrawls and reprocesses the website.
